

Spellman's Shipborne Power Feed Equipment (PFE) is used within Shipborne Submarine Fibre Optic Cable systems for telecommunications.

Our **Shipborne PFE** solution has been installed on many of the major cable laying ships around the world becoming the preferred choice of cable shipbuilders and owners.

A typical PFE system provides for 20kWatt capability with constant power performance over the range 8kV to 10kV.

A range of PFE's at various output power levels are available, at 13, 16, 20 and 26kW. We also manufacture an active dummy load at output levels between 2kW and 40Kw - this can be included as part of the PFE suite.
